Using Augmented Reality Content with ARC

ClassVR headsets come equipped with a front-facing camera, which opens up opportunities to use Augmented Reality: layering computer-generated content over the camera view.

ClassVR comes with our own Augmented Reality Classroom (ARC) app, designed for use with the AR worksheets that can be downloaded from the ClassVR Portal.

First, you'll need to open ARC from within the headset using a select gesture and wait for the app to launch.

Once ARC has loaded, you'll be able to see through the camera. Look at the front page of one of our specially-designed worksheets, which act as trigger images.

Within a few seconds, you should see a related 3D model pop up from the page.

Some models have a white button to press, which causes an animation to begin.

Rotate the worksheet on a table top to see the model from all angles.
